

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application.

1. (Currently amended) A method comprising:

applying a handover algorithm in a mobile terminal, wherein the handover algorithm is configured to select one of at least two available channels to be used for a connection from the mobile terminal, and wherein a user interface component of the terminal may be set to an inactive state or to an active state, wherein the inactive state is the state of the user interface component when the user interface component is not being actively used, the method further comprising:

checking the state of the user interface component automatically in response to detecting a need to initiate the handover algorithm, ~~and~~

preventing, on the basis of the checking, application of the handover algorithm in response to detecting that the current state of the user interface component is inactive, and

initiating the handover algorithm in response to detecting the state of the user interface component to change from the inactive state to the active state.

2. (Canceled)

3. (Original) A method according to claim 1, wherein the checking of the state occurs in response to detecting a new available network resource.

4. (Canceled)

5. (Original) A method according to claim 1, wherein the terminal comprises a body portion and a lid which is connected to the body portion and can be moved with respect to the body portion, and wherein the state of the lid in relation to the body portion is checked.

6. (Original) A method according to claim 1, wherein the terminal comprises a keypad and a keypad locking functionality for locking the keypad, whereby the state of the keypad locking is checked.

7. (Original) A method according to claim 1, wherein the terminal comprises a screen saver functionality, the state of which is detected, whereby the state of the user interface component is inactive when the screen saver functionality is applied and the state of the user interface component is active when the screen saver functionality is not applied.

8. (Original) A method according to claim 1, wherein the handover algorithm determines a change between channels of different network technologies.

9. (Currently amended) An apparatus comprising at least one processor and memory, wherein computer program code is configured to, with the at least one processor cause the apparatus at least to:

check a state of a user interface component automatically in response to detecting a need to initiate a handover algorithm, wherein the user interface component is adjustable in an inactive state or in an active state, the inactive state being the state of the user interface component when the user interface component is not being actively used, ~~and~~

if the current state of the user interface component is inactive, the processor is configured to prevent, on the basis of the checking, application of the handover algorithm, configured to select one of at least two available channels to be used for a connection from the apparatus, and  
initiate the handover algorithm in response to detecting the state of the user interface component to change from the inactive state to the active state.

10. (Canceled)

11. (Canceled)

12. (Canceled)

13. (Previously presented) An apparatus according to claim 9, wherein the apparatus is configured to check the state in response to detecting a new available network resource.

14. (Canceled)

15. (Previously presented) An apparatus according to claim 9, wherein the apparatus comprises a first portion and a second portion movable with respect to the first portion, and

the apparatus is configured to check the state based on the position of the second portion with respect to the first portion.

16. (Previously presented) An apparatus according to claim 15, wherein the apparatus comprises a body portion and a lid which is connected to the body portion and can be moved with respect to the body portion, and

the apparatus comprises a sensing arrangement for detecting the state of the lid.

17. (Previously presented) An apparatus according to claim 9, wherein the apparatus comprises a keypad and a keypad locking functionality for locking the keypad, and

the apparatus is configured to check the state of the keypad locking.

18. (Previously presented) An apparatus according to claim 9, wherein the apparatus comprises a screen saver functionality, the state of which is detected, whereby the state of the user interface component is inactive when the screen saver functionality is applied and the state of the user interface component is active when the screen saver functionality is not applied.

19. (Previously presented) An apparatus according to claim 9, wherein the handover algorithm determines a change between channels of different network technologies.

20. (Previously presented) An apparatus according to claim 9, wherein the apparatus comprises a timer configured to determine the state of the user interface component as inactive after a predetermined time period has elapsed after the latest user activity.

21. (Currently amended) A computer readable medium comprising program code for controlling a mobile terminal comprising a user interface and a handover algorithm by executing the program code in a processor of the terminal, wherein the program code comprises

a program code portion for causing the terminal to check the state of the user interface component automatically in response to detecting a need to initiate the handover algorithm, wherein the user interface component is adjustable in an inactive state or in an active state and the inactive state is set as the state of the user interface component when the mobile terminal is not being actively used, and

a program code portion for causing the terminal, if the current state of the user interface component is active, to apply, on the basis of the checking, the handover algorithm configured to select one of the at least two available channels to be used for a connection from the mobile terminal, and if the current state of the user interface is inactive, to prevent application of the handover algorithm, and

a program code portion for causing the terminal to initiate the handover algorithm in response to detecting the state of the user interface component to change from the inactive state to the active state.

22. (Previously presented) A method according to claim 1, wherein checking the state of the user interface component comprises checking the state of a mechanical user interface component.

23. (Currently amended) A method according to claim 1, wherein radio measurements are ~~omitted~~performed in response to the current state of the user interface component being ~~inactive~~active.

24. (Previously presented) An apparatus according to claim 9, wherein the apparatus is configured to check the state of a mechanical user interface component.

25. (Currently amended) An apparatus according to claim 9, wherein the apparatus is configured to ~~omit~~perform radio measurements in response to the current state of the user interface component being ~~inactive~~active.

26. (Previously presented) A computer readable medium according to claim 21, wherein the program code causes the mobile terminal to check the state of a mechanical user interface component.

27. (Currently amended) A computer readable medium according to claim 21, wherein the program code causes the mobile terminal to ~~omit~~perform radio measurements in response to the current state of the user interface component being ~~inactive~~active.

28. (Previously presented) An apparatus according to claim 9, wherein the apparatus is a mobile terminal comprising the user interface.

29. (Previously presented) A method according to claim 1, wherein the need to activate the handover algorithm is based on channel measurements.

30. (Previously presented) An apparatus according to claim 9, wherein the apparatus is configured to activate the handover algorithm on the basis of channel measurements.
